bits – professional screwing attachments of high alloyed material S2

Forged attachments

cross-headed and flat bits are made by special technology of precise forging. It enables achieving of high accuracy in shape, together with increasing in hardness in comparison with the bits by 20 %.

TiN layer

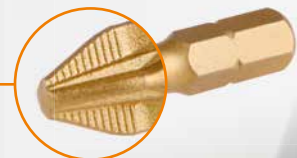

double applied on the surface of screwing spikes, it maximally increases the hardness, wipe resistance and frictional qualities prevent slipping out of the meshing.

Diamond grains

on the surface of the spike they really "bite" into the head of the wood screw or screw and enable to transfer maximum tightening torque. They are the best guarantee for staying in the meshing.

Nonskid grooves

on the working surfaces of the spikes made by forging are another very effective protection against the slipping out of the meshing.
